WHY IS IT SO DIFFICULT?

CHALLENGES

How does artificial intelligence fit into our current business paradigm?

We can’t get our models into production in a timely manner.

We need flexibility in our software deployment patterns.

We can’t find, hire & retain enough high-level talent.

We are struggling to adopt the data-driven decision making within our corporate culture.

How to Develop and Deploy Complex Models Easily?

SAS DLpy Package on GitHub

Train the model

```
model.fit(train_image, mini_batch_size=12, max_epochs=20, optimizer=dict(algorithm=dict(method='adam', learningrate=.001)))
```

```
NOTE: Training based on existing weights.
WARNING: Source layer conv1 to batch normalization layer bn_conv1 includes a bias term.
NOTE:  The Synchronous mode is enabled.
NOTE:  The total number of parameters is 23514243.
NOTE:  The approximate memory cost is 82974.00 MB.
NOTE:  Loading weights cost       0.23 (s).
NOTE:  Initializing each layer cost     282.85 (s).
NOTE:  The total number of threads on each worker is 32.
NOTE:  The total mini-batch size pe

NOTE:  Target variable: _label_
NOTE:  Number of levels for the tar
NOTE:  Levels for the target variab
NOTE:  Level      0: NoDamage
NOTE:  Level      1: Major
NOTE:  Level      2: Minor
```

Model Deployment

Create Astore & ONNX of deep learning model

```
model1.deploy(path='/data/model/CarDamage', output_format='astore')
```

```
model1.deploy(path='/data/model/CarDamage', output_format='onnx')
```

- RNN based tasks: text classification, text generation, and sequence labeling
- Object detection
- Time series processing and modeling
- Processing audio files and creating speech recognition models

- Additional pre-defined network architectures such as DenseNet, DarkNet, Inception, and Yolo
- Enhanced data visualization and metadata handling

Note: With the release of DLPy 1.0, we moved to python-style functions and parameters. This might break your old code with camelCase parameters and functions.

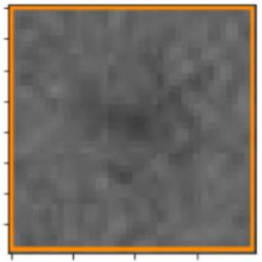
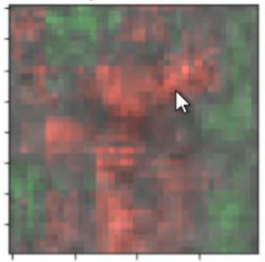
Report

Potential Lesion



Explanations



The model has found two lesions with high probabilities (green boxes) and one potential lesion (orange box) from the scan. The potential lesion area and the explanations are shown above. The red pixels in the explanations highlight the area that contributes to the lesion prediction according to the model. The green pixels highlight the area that the model finds unlikely to contain a lesion.
